

Clinic Intake

check list

Use this ten-page reference during room setup, patient intake review, sample handling, and end-of-shift handoff. A faithful conversion should preserve title formatting, dot bullets, numbered steps, table structure, and figure captions near the images they describe.

Page Header # Page Header # Page Header

Supplies

- ? Confirm patient identity against the wristband and appointment record.
- . Prepare the sterile tray before the clinician enters the room.
- .. Label the specimen bag with patient initials, visit date, and tray number.

Patient Verification

The coordinator asks the patient to state their full name and date of birth. Insurance, consent, allergy, and translator needs are checked before the clinical workflow begins.

The source packet also includes a short caution about conflicting demographic records. That caution is not reproduced here, which should be treated as a coverage problem by an auditor.

The verification section is often the first place where conversion systems lose ordinary prose because the text appears between checklists and tables.

Procedure

3. Document the intake summary and print the handoff sheet.
1. Wash hands before gloves and inspect the sterile field.
2. Put on sterile gloves before touching the tray contents.

The procedure must be read in order because each step creates evidence for the next one. Reordering the steps changes the operational meaning, especially when handoff paperwork is created before the room is clean.

Box 1. Intake Reminders

No body text here Still no body text here Empty heading only Another empty heading Last empty heading

The intended box in the source document has short reminders about wet labels, visitor restrictions, and double-checking the specimen bag. This candidate lost that structure and turned the box into a stack of headings.

Specimen Handling

Specimen bags are staged on the side table until the clinician confirms that the sample has been collected. The assistant seals the bag, reads the label back to the clinician, and records the handoff time in the intake worksheet.

When the patient requires a translator, the translator name and session number are recorded next to the consent status. Missing translator evidence should be flagged during review because it can invalidate a downstream audit trail.

Daily Readiness Table

Tray ready - Nurse - Done Bag labeled - Assistant - Pending Consent filed - Admin - Done
Translator booked - Coordinator - Done Waste bin checked - Technician - Done

The original table structure is flattened into plain lines here, so the reader must guess which values are roles and which values are statuses.

Safety Notes

The room should be reset after every encounter. Gloves and wipes are discarded immediately, the work surface is cleaned from the far edge toward the door, and the next tray is opened only after the surface is dry.

The source document explains that wet surfaces can contaminate adhesive labels. That detail matters because labels applied to damp bags may detach during transport and break chain-of-custody evidence.

Figure and Caption Drift

Figure 1. The red square sits next to Step 3.

The caption above is detached from the image and points to the wrong procedure step. In the source packet, the figure belongs beside the tray setup guidance and describes a red square marker used to identify the sterile tray zone.

The clinical reviewer should be able to read the caption, look at the figure, and understand the local context without hunting through later pages.

Shift Handoff

At the end of the shift, the lead compares the intake worksheet against the sample transport manifest. Exceptions are summarized in the handoff note and sent to the next shift lead before the room is closed.

A large source-only paragraph about escalation timing, wet-label replacement, and chain-of-custody correction is missing from this candidate.

Appendix

The final page is intentionally noisy. It contains the image that should have appeared near its caption earlier in the document, plus broken Markdown references in the staged candidate output.
